

SHERLOCK HOLMES

A 3D Point-and-Click Adventure Game

Warsaw Film School

The Project and My Role

I focus on level design, puzzles, 3D characters and the player's feeling of immersion.

- We are a four-person team, and each person is responsible for a different part of development.
- My work connects level design, environmental puzzles and 3D character work.
- My main goal is to make the player feel like a detective, not only like someone clicking on objects.

I design the house as both a setting and a playable puzzle.

What I Do

My work combines creative decisions with technical implementation.

01 Level Design

I plan rooms, routes, pacing and the order in which players discover information.

02 Environment Design

I use props, lighting and architecture to make each location communicate a story.

03 3D Character Design

I create and adapt characters that fit the stylised visual direction of the game.

04 Locomotion & Animation

I set up movement, navigation and animation feedback so characters feel present in the scene.

05 Story & Environmental Puzzles

I connect narrative events with mechanics, clues and physical puzzles in the environment.

06 Camera, Light & Visual Effects

I use camera work, light and effects to direct attention and build detective atmosphere.

Building a Mystery Inside the House

THE PREMISE

I use Lady Edith's murder and the search for young Ethel to give every puzzle a narrative purpose.

When I design a room, I try to make it reveal one new piece of the story: a witness, an object, a hidden mechanism or a trace.

Making the House Tell Its Own Story

- I use warm domestic rooms in contrast with colder, darker spaces below ground.
- I place furniture, lighting and props so they can become clues before the player reads dialogue.
- In the basement, brick walls, narrow routes and darkness create pressure and curiosity.

How I Let the Player Investigate

01 Detective Vision

I use it to reveal traces, interactive objects and hidden evidence.

02 Magnifying Glass

It lets the player examine small details and visual patterns.

03 Objects & Locks

I build simple collection, key and lockpicking interactions.

04 Environmental Puzzles

The player reads the room, operates secret routes.

Designing the Connection of Evidence

I designed Idea Points so the player discovers evidence and connects it in a logical order.

For example, the body, fireplace, window and hidden wall reconstruct the murder scene and reveal a secret mechanism.

Making Watson Part of the Puzzle

- I designed character switching so the player can control both Sherlock and Dr Watson.
- Watson can hold mechanisms, move heavy objects and help Sherlock reach a solution.
- This turns switching into a meaningful puzzle decision, rather than a cosmetic feature.

Example: two bricks open a secret wall only when both characters cooperate.

Turning My Design Into Playable Systems

UNITY WORKFLOW

- I use Unity to build 3D scenes, navigation and interaction logic.
- I write and adapt C# scripts for puzzles, character switching and clue progression.
- I use Cinemachine, Animator and Visual Effects to improve camera feedback and atmosphere.

What I Have Learned

- Game development has two connected parts: gameplay and story. The player experience is strongest when they support each other.
- The most important and difficult part is teamwork: keeping the team engaged, communicating clearly and connecting everyone's work.
- A strong puzzle needs a clear rule, visual feedback and a story reason to exist.

Thank you for your attention.

I will be happy to answer any questions.

MY ROLE IN

SHERLOCK HOLMES

Game Development

Warsaw Film School

The Project and the Team

A four-person diploma project with shared creative and technical responsibilities.

- We are creating a stylised 3D point-and-click adventure inspired by Sherlock Holmes.
- Each member of our four-person team develops a different part of the game.
- My work connects level design, puzzles, 3D characters and the player's feeling of immersion.

My goal: make the player feel like a detective.

How I Build the World

01 Level Design

I plan rooms, routes, pacing and the order in which players discover information.

02 Environment Design

I use props, lighting and architecture to make every location communicate a story.

03 3D Character Design

I create and adapt characters that match the game's stylised visual direction.

Making the World Respond

Locomotion & Animation

I set up movement, navigation and animation feedback so characters feel present in the scene.

Story & Environmental Puzzles

I connect narrative events with mechanics, clues and physical puzzles in the environment.

Camera, Light & Visual Effects

I use camera work, light and effects to direct attention and build detective atmosphere.

Making the Player Feel Like a Detective

- I use Detective Vision and the magnifying glass to turn observation into an active part of gameplay.
- I design clues as part of the environment, so the player can notice, inspect and connect them.
- I make each puzzle serve the story: it should explain a character, a place or an event.

The player should investigate, not simply click through the game.

What I Have Learned

- Game development has two connected parts: gameplay and story. The player experience is strongest when they support each other.
- The most important and difficult part is teamwork: keeping the team engaged, communicating clearly and connecting everyone's work.
- A strong puzzle needs a clear rule, visual feedback and a story reason to exist.

Thank you for your attention.

I will be happy to answer any questions.
